**SYSC 2006 - Foundations of Imperative Programming - Fall 2015**

**Lab 10 - Linked Lists**

**Objective**

To review the linked list code that was presented in recent lectures, and to develop some functions that provide additional operations on linked lists.

**Attendance/Demo**

To receive credit for this lab, you must demonstrate your solutions to the exercises. **Also, you must submit your lab work to cuLearn.** (Instructions are provided in the *Wrap Up* section at the end of this handout.)

When you have finished all the exercises, call a TA, who will review the code you wrote. For those who don't finish early, a TA will ask you to demonstrate whatever code you've completed, starting about 30 minutes before the end of the lab period. **Any unfinished exercises should be treated as "homework"; complete these on your own time, before your next lab.**

**General Requirements**

You have been provided with three files:

- `singly_linked_list.c` contains several functions that operate on singly-linked list. The `print_linked_list` function prints a linked list of integers using the format:

*value1 -> value2 -> value3 -> ...*

In addition, this file has functions that:

- search a linked list to determine if it contains a specified value;
- insert an integer at the front of a linked list;
- append an integer to the rear of a linked list;
- remove the first node in a linked list;
- remove the last node in a linked list.

The code in these functions was presented in recent lectures.

- `singly_linked_list.h` contains declarations for a singly-linked list data structure and prototypes for functions that operate on this linked list;
- `main.c` contains a simple *test harness* that exercises the functions in `singly_linked_list.c`. Unlike the test harnesses provided in previous labs, this one does not use the sput framework. The test code doesn't compare the actual and expected results of each test and keep track of the number of tests that pass and fail. Instead, the expected and actual results are displayed on the console, and you have to review this output to

determine if the functions are correct.

Finish each exercise (i.e., write the function and verify that it passes all of its tests) before you move on to the next one. Don't leave testing until after you've written all your functions.

None of the functions you write should perform console input; i.e., contain `scanf` statements. Unless otherwise specified, none of your functions should produce console output; i.e., contain `printf` statements.

## Instructions

1. Launch Pelles C and create a new Pelles C project named `linked_list` (all letters are lowercase, with underscores separating the words). If you're using one of our lab computers, the project type must be **Win 64 Console program (EXE)**. (Although the 64-bit edition of Pelles C can build 32-bit programs, you may run into difficulties if you attempt to use the debugger to debug 32-bit programs.) If you're using your own computer, the project type should be **Win 64 Console program (EXE)** or **Win32 Console program (EXE)**, depending on whether you installed the 64-bit or 32-bit edition of Pelles C. After creating the project, you should have a folder named `linked_list`. Check this. If you do not have a project folder named `linked_list`, close this project and repeat Step 1.
2. Download file `main.c`, `singly_linked_list.c` and `singly_linked_list.h` from cuLearn. Move these files into your `linked_list` folder.
3. You must add `main.c` and `singly_linked_list.c` to your project. From the menu bar, select **Project > Add files to project...** In the dialogue box, select `main.c`, then click **Open**. An icon labelled `main.c` will appear in the Pelles C project window. Repeat this for `singly_linked_list.c`.

You don't need to add `singly_linked_list.h` to the project. Pelles C will do this after you've added `main.c`.

4. Build the project. It should build without any compilation or linking errors.
5. Execute the project. The test harness reveals that several functions do not produce correct results (look at the output printed in the console window and, for each test case, compare the expected and actual results). This is what we'd expect, because several of the functions in `singly_linked_list.c` are incomplete.
6. Open `singly_linked_list.c` and review the functions that contain the algorithms that were designed and implemented in recent lectures. Make sure you understand these functions before you start Exercise 1.

### Exercise 1 (Difficulty Level: Easy)

File `singly_linked_list.c` contains an incomplete definition of a function named `count`. The function prototype is:

```
int count(IntNode *head, int target);
```

Parameter `head` points to the first node in the linked list.

This function counts the number of nodes that contain an integer equal to `target`, and returns that number.

This function should return 0 if the list is empty (parameter `head` is `NULL`).

Finish the implementation of `count`.

Build the project, correcting any compilation errors, then execute the project. The test harness will run. Inspect the console output, and verify that your `count` function passes all the tests before you start Exercise 2.

### Exercise 2 (Difficulty Level: Easy)

File `singly_linked_list.c` contains an incomplete definition of a function named `index`. The function prototype is:

```
int index(IntNode *head, int target);
```

Parameter `head` points to the first node in the linked list.

This function that returns the index (position) of the first node in a linked list that contains an integer equal to `target`. If `target` is not in the list, the function should return -1.

The function should return -1 if the list is empty (parameter `head` is `NULL`).

The function uses the numbering convention that the first node is at index 0, the second node is at index 1, and so on.

Finish the implementation of `index`.

Build the project, correcting any compilation errors, then execute the project. The test harness will run. Inspect the console output, and verify that your `index` function passes all the tests before you start Exercise 3.

### Exercise 3 (Difficulty Level: Easy)

File `singly_linked_list.c` contains an incomplete definition of a function named `fetch`. The function prototype is:

```
int fetch(IntNode *head, int index);
```

Parameter `head` points to the first node in the linked list.

This function will return the integer stored in the node at the specified index (position)

This function must handle these three cases:

- If the list is empty, the function should terminate via `assert`.
- If parameter `index` is valid ( $0 \leq \text{index} < \text{number of nodes in the linked list}$ ), the function should return the value stored in the corresponding node. (The index of the first node is 0, the index of the second node is 1, etc.)
- If parameter `index` is negative or  $\geq \text{number of nodes in the linked list}$ , the function should terminate via `assert`.

Finish the implementation of `fetch`.

Build the project, correcting any compilation errors, then execute the project. The test harness will run. Inspect the console output, and verify that your `fetch` function passes all the tests before you start Exercise 4.

### Exercise 4 (Difficulty Level: Moderate)

File `singly_linked_list.c` contains an incomplete definition of a function named `insert`. The function prototype is:

```
IntNode *insert(IntNode *head, int index, int x);
```

Parameter `head` points to the first node in the linked list, or is `NULL` if the linked list is empty.

This function will insert a new node containing integer `x` at the specified index (position). The function uses the numbering convention that the first node is at index 0, the second node is at index 1, and so on. Parameter `index` must be in the range  $0 \leq \text{index} < \text{length}$  (where *length* is the number of nodes in the linked list). (This means that, if the linked list is empty, a node can be inserted at index 0.) If `index` is invalid, the function should terminate via `assert`.

Note that this function does not replace the contents of the node (if any) that is currently at position `index`. Instead, that node will be at position `index + 1` after the new node is inserted ahead of it.

The function returns a pointer to the first node in the modified linked list.

There are several cases you should consider when designing this function.:

- The linked list is empty. There are two subcases:
  - `index` is 0. The function will return a pointer to a list containing one node.
  - `index` is invalid.
- The function is passed a pointer to a linked list containing one or more nodes. There are four subcases:
  - `index` is 0. The function will insert the node at the front of the linked list.
  - `index` is greater than 0 and less than the number of nodes in the linked list. The function will insert a new node at the specified position.
  - `index` equals the number of nodes in the linked list. The function will append a new node after the last node.
  - `index` is invalid.

Finish the implementation of `insert`.

Hint: you should be able to reuse parts of the algorithms from the `fetch` function you wrote for Exercise 3 and the `insert_front` and `append_rear` functions that were presented in lectures (the code is in `singly_linked_list.c`).

Build the project, correcting any compilation errors, then execute the project. The test harness will run. Inspect the console output, and verify that your `insert` function passes all the tests.

## Wrap-up

1. Remember to have a TA review and grade your solutions to the exercises, assign a grade (Satisfactory, Marginal or Unsatisfactory) and have you initial the demo/sign-out sheet.
2. The next thing you'll do is package the project in a ZIP file (compressed folder) named `linked_list.zip`. To do this:
  - 2.1. From the menu bar, select **Project > ZIP Files...** A **Save As** dialog box will appear. If you named your Pelles C project `linked_list`, the zip file will have this name by default; otherwise, you'll have to edit the **File name:** field and rename the file to `linked_list` before you save it. **Do not use any other name for your zip file** (e.g., `lab10.zip`, `my_project.zip`, etc.).
  - 2.2. Click **Save**. Pelles C will create a compressed (zipped) folder, which will contain copies of the the source code and several other files associated with the project. (The original files will not be removed). The compressed folder will be stored in your project folder (i.e., folder `linked_list`).

3. Before you leave the lab, log in to cuLearn and submit `linked_list.zip`. To do this:
  - 3.1. Click the **Submit Lab 10** link. A page containing instructions and your submission status will be displayed. After you've read the instructions, click the **Add submission** button. A page containing a **File submissions** box will appear. Drag `linked_list.zip` to the **File submissions** box. **Do not submit another type of file (e.g., a Pelles C .ppj file, a RAR file, a .txt file, etc.)**
  - 3.2. After the icon for the file appears in the box, click the **Save changes** button. At this point, the submission status of your file is "Draft (not submitted)". If you're ready to finish submitting the file, jump to Step 3.4. If you aren't ready to do this; for example, you want to do some more work on the project and resubmit it later, you can leave the file with "draft" submission status. When you're ready to submit the final version, you can replace or delete your "draft" file submission by following the instructions in Step 3.3, then finish the submission process by following the instructions in Step 3.4.
  - 3.3. You can replace or delete the file by clicking the **Edit my submission** button. The page containing the **File submissions** box will appear.
    - 3.3.1. To overwrite a file you previously submitted with a file having the same name, drag another copy of the file to the **File submissions** box, then click the **Overwrite** button when you are told the file exists ("There is already a file called..."). After the icon for the file reappears in the box, click the **Save changes** button.
    - 3.3.2. To delete a file you previously submitted, click its icon. A dialogue box will appear. Click the **Delete** button., then click the **OK** button when you are asked, "Are you sure you want to delete this file?" After the icon for the file disappears, click the **Save changes** button.
  - 3.4. Once you're sure that you don't want to make any changes, click the **Submit assignment** button. A **Submit assignment** page will be displayed containing the message, "Are you sure you want to submit your work for grading? You will not be able to make any more changes." Click the **Continue** button to confirm that you are ready to submit your lab work. This will change the submission status to "Submitted for grading".
